

LET'S GET
BUILDING

But first...

What kind of DOM manipulation?

- To select elements within your HTML
 - `document.querySelector()` / `querySelectorAll()`
 - `document.getElementById()`
 - `document.getElementsByClassName()`
 - `document.getElementsByTagName()`

- Appending something to your page?
 - `document.createElement()`
 - `.appendChild()`
- Other things you might find useful
 - `event.target`
 - `.removeChild()`
- What other kind of logic?
 - Loops!
 - Functions!

NAMING CONVENTIONS

- NAME YOUR CHILDREN WISELY (or subject them to a lifetime of humiliation)

CAMEL CASE FOR JAVASCRIPT

```
<script>
  function rideCamel(){
    //some code here
  }
</script>
```

```
<script>
  let myCamelName = document.getElementById
  ("my-camel-name").value;
</script>
```
